Memory clear - undocumented feature MK3 version

A new feature of MEMORY CLEAR has been introduced to the MK3 version (latest production 2003). If you switch the MK3 receiver on with the SCAN button depressed until the power-on message has ended, all memory channels will be deleted permanently (useful if you need to dump the frequencies in a rush). The search data and other programmable data is left intact.

Caution: If you press SCAN before the power-on message has disappeared, there is a chance that you will accidentally delete all you memory channels! We know this accident has happened already to a few customers :-(

The new feature also applies to the AR8600 MK2 receiver. The change is a response to public request, **earlier production receivers cannot be updated** (it would require a change of CPU which employs 'miniature pitch soldered' mounting, this is not cost effective to replace - it is not simply FLASH upgradeable). This addition is in line with AOR's commitment to ongoing product development.

Achtung! Alle Speicherdaten werden unwiderruflich gelöscht!
